

A BIBLIOGRAPHY OF SEMITIC LINGUISTICS (1940-2006)

Dr. Gregorio del Olmo Lete

INTRODUCTION

It seems obligatory at the beginning of this bibliography to set out its limits and justify its objectives. The aim of the bibliography is to collect and arrange systematically only those studies directly or mainly related to subjects of *Semitic linguistics*, namely, those centred on the study of languages and their phonological, morphological, syntactic and semantic constituents, from both the comparative perspective (close and distant relationship) and the immanent perspective (grammar and lexicon). Consequently, all other studies dealing with the history of the societies which use or used those languages and with everything that is built on them (socio-political history, literature, religion and 'culture' in general), remain excluded.

This limitation may seem impossible or at the very least without justification and minimalist, in some way resorting to 'formalism', giving up the basic element, whose development a language has to perform, namely, the shaping of a universe of social representations, which generates a particular way of communication and creativity. One could say that it means abandoning the 'context' in which every linguistic formulation has its meaning, being at the same time its outcome. But we cannot forget, in answer to such an objection, that our purpose has a fixed point of support: it is constructed exclusively on 'texts' as the products of language, which are the reference point for testing and validating results. And if it is true that 'the proposition is the world' (Wittgenstein), then linguistic analysis is the basis for the understanding of any representation.

Our intention is to provide specialist information that arranges and classifies as much as possible the vast amount of data constantly presented by the general bibliography on Semitic languages and cultures. In this way, access to such information will be made easier, with better focus on the more important issues of research. At the same time we intend to collect the information and classify it in a uniform manner, in this way making it possible to compare across languages the research being carried out within the various languages, since such research often ignores other languages.

This first instalment is devoted to general topics in respect of the Semitic family as a whole. In this connexion, studies dealing with its relationship to other linguistic groups and families (Nostratic, Hamitic or Afro-Asiatic) will be taken into account in as much as they bear on the study of Semitics proper. Here, Nostratic is taken in its wider meaning, as used today among Indo-European scholars. In order to avoid any prejudgements, in successive instalments we will offer linguistic bibliographies for each Semitic language as well as for each Semitic language family according to its name, without attempting to decide on its suitability or incorporate it within a particular preferred classification. This is precisely one of the problems the present bibliographical tool aims to address. The series will include the following headings: [East and North Semitic], Akkadian, Eblaite, Amorite, Ugaritic, [Northwest Semitic/Canaanite], Phoenician, Hebrew, Aramaic/Syriac, South Semitic, Old (Epigraphic) North and South Arabian, Modern South-Arabian, Arabic and Ethiopic, both classic and modern, the pertinent dialectal variations being included under the appropriate heading.

The cross-references to the individual bibliographies of each of these languages and groups of languages are essential for extracting full information on a specific linguistic issue at either a general or a comparative level. In the first instalment, any comparison of (at least two) languages is noted. When the title specifies the language compared, the item will be repeated in the corresponding bibliography ("Comparative Level").

Unlike the other topics, where the aim is to be exhaustive, the Bibliography on Semitic lexicography has been kept within less strict limits, otherwise the task would have been endless. Studies or references to particular lexemes have not been recorded in the instalment devoted to

Common Semitics, unless they bear on comparative issues. In principle, only treatments of 'roots' or 'semantic fields' have been taken into account. Nevertheless, the criterion has not always been applied stringently, since often it is difficult to draw the line between particular and comparative treatments. In the other instalments, devoted to particular languages, concrete lexemes also have been recorded, although in a non exhaustive way. In any case, this section of the bibliography has to be taken as merely indicative and perfunctory, and reference to up-to-date lexicographic records is unavoidable. A thorough lexicographical entry should even include reference to the main studies on editions and commentaries on the texts, where the particular lexeme appears, but such textual studies have not been included. As for book reviews, only the most significant have been listed.
